VARIABLE LOAD TYPE SPRING HANGERS & SUPPORTS

Variable Load Type Spring Hangers and Supports are used for supporting and carrying the pipeline at required spans, without preventing the vertical movement of the pipe subject to thermal changes. There is a wide range of application, the only restriction being the range of travel. Since the pipe load is carried directly by the spring, the vertical travel of pipe during operation causes a variation in the reaction force exerted by the spring. The calculated Operation Load and travel are used in choosing the Load Group and travel group of the unit. The Cold set load thus found according to the performance characteristics of the selected unit is the pre-set pinning load. In choice, care should be taken to keep the percent of load variation with respect to Operation Load to be below 25 %.

Units are manufactured to satisfy various load groups as shown in the Selection Chart, having three different travel ranges. K, O and U travel ranges specify 35 mm, 70 mm and 140 mm of travel respectively. Type letters A, B, C, D, F and G represent the various modes of connection the hanger or support is placed, with respect to the main structural frame. These are sketched on the following pages.

The Supports and Hangers are equipped with restrictions against overload and overtravel. Units are delivered as pre-set pinned in accordance with the Cold Set Load. The Load Indicators on the outer pipe indicate the Load and travel position with respect to the preset value. There is no need for inspection and maintenance.

Springs are designed and manufactured according to TS 1440 and TS 1441, the materials complying with DIN 17221, DIN 17222 and DIN 17223. All units are factory tested and marked accordingly. Provided properly used within the load and travel limits shown on the Indicator label, each unit is guaranteed for two years or 10,000 hours of operation starting from date of delivery.

ORDERING EXAMPLE:

XX . X . X

Where;

The number in the first two digits represent the Load Group,

the letter in the third digit represents the travel range (K, O, U)

the letter on the fourth digit represents the type of connection (A, B, C, D, F or G)

For any requirement that cannot be fitted in the Selection Chart please consult our engineers for special design and alternative solutions. Please also note that the dimensions given here onto are not binding and we reserve the right to make any alterations we may deem necessary, without altering the performance characteristics.

CONSTANT LOAD TYPE SPRING HANGERS AND SUPPORTS

In applications where variable load type Spring Hangers and Supports cannot be used due to load and travel requirements, or where the reaction force of the support is required to be kept constant with respect to the vertical movement of the pipeline, Constant Load Type Spring Hangers and Supports are used. In this design the load is not carried directly by the spring. The geometry and movement arm combination is so designed that within the specific travel range the reaction force exerted by the support is CONSTANT, independent of the compression in the spring.

The geometric and connection types are shown on the following pages. The design criteria and test properties for the springs are the same as those for the springs used in the variable load type Hangers and Supports. Springs are designed and manufactured according to TS 1440 and TS 1441 , the materials complying with DIN 17221 , DIN 17222 and DIN 17223. All units are factory tested are marked accordingly. Provided properly used within the load and travel limits shown on the Indicator label, each unit is guaranteed for two years or 10.000 hours of operation starting from date of delivery.

ORDERING EXAMPLE: SA . XX. XXX. CXX . X

Where;

**SA represents Constant Load Hanger or Support,
numbers in the next two digits represent the Load Group,
numbers in the next two or three digits represent the Travel in mm,
numbers following the letter C represent the Type of location
(50,51,52....56),
the letter in the last digit represents the Type of
Connection(J,K,L,M.....ETC)**

For any requirement that cannot be fitted in the Selection Chart please consult our engineers for special design and alternative solutions. Please also note that the dimensions given here onto are not binding and we reserve the right to make any alterations we may deem necessary, without altering the performance characteristics.
